

Expository Essay on Importance of Planting Trees

Introduction:

The importance of tree plantation must never be overlooked. Tree plantation has now become a necessity these days with the exponential growth rate of pollution in our environment. The process of tree plantation has to do with the transplanting of the seedlings of trees to spread the green scenery around and grow forests.

There are a lot of reasons why engaging in tree plantation is very important for our environment. There are a lot of benefits that tree plantation brings to our environment and mankind. We should endeavor to do our best individually and collectively to ensure we maintain our environment and also keeping the planet healthy knowing that just a little effort from us can go a long way in achieving this.

Tree plantation has a lot of benefits and a few of them will be discussed here just to remind us of how important tree plantation is:

1. The Economy Grows with Tree Plantation:

Trees are very important raw materials that can be used in the production of a variety of goods. We can get rubber, wood and so many more from trees that can be turned into utensils, furniture, decorative items, paper and almost anything. Wood from trees is also a major element in the construction of houses and other structures. Trees produce fruits that can be consumed directly or processed into different foods. A lot of the goods that are produced from trees help to build the local economy and serve as a means of export thus, boosting the economy as a whole.

2. Trees Serve as Homes or Habitat to Various Species of Bird and Wildlife:

Trees are a home to birds and a host of other animals. Animals that have trees as their habitat include tree frog, tree kangaroo, flying lemur, spider monkey, koala and the python of the green tree. All of these animals live around or on the trees and their food are gotten from the trees. The leaves of the trees and the fruits of the trees are some of the parts of the trees that the animals eat. There are some other wild animals that have the forests (a group of trees) as their own habitat.

Deforestation and the constant cutting down of trees has made quite a number of these wild animals extinct while some others are very close to extinction. If trees

are not there for these animals to thrive, they would surely die. Tree plantation has a big role to play in helping these animals which is important for the maintenance of biodiversity in our environment. Therefore, Biodiversity is very important for the maintenance of the balance of ecology in our environment.

3. Tree Plantation Helps Battle Deforestation:

Tree plantation goes a long way in the battling of deforestation. Due to urbanization and modernization, the number of trees that we cut down is not commensurate with the number of trees that we plant. We need to plant more trees to ensure that our forests are not totally deforested.
